Edwin Alvarado: For the midterm, I coordinated the team and managed our submission logistics, including getting our dataset approved by Mr. Rao and confirming the required file structure for our GitHub repo. I submitted our chosen Stroke Prediction Dataset for approval and worked through the condition that we balance it using SMOTE. I set up and ran the preprocessing notebook in Google Colab, uploading the raw dataset and executing the full pipeline. I verified that each step ran correctly checking that the stratified 70/30 split preserved the class distribution, confirming that SMOTE was applied only to the training data (balancing it from 174 to 3,403 stroke cases) while the test set stayed untouched, and making sure there were no missing values after imputation. I then generated and downloaded the final cleaned dataset and organized all project files in our shared Drive folder so the team could access them.

Kala Hayes:

For the midterm project, I reviewed the notebook created by my teammate to verify that the data processing steps and outputs were correct. I examined each cell to confirm that it ran properly without errors. I reviewed the visualization results for accuracy and consistency, and communicated with my teammates to confirm that everything looked correct. I also coordinated with my teammate to verify if any further information or project materials were needed.

Anashrah Adil:

For this project I created and managed the GITHUB repository, uploading all files according to the requirements. I also reviewed the stroke dataset and performed a preprocessing quality suite section within the colab notebook. It acts as a quality check for our pipeline confirming that all missing values were filled and all categorical text were properly filled with numbers.

Zain Ahmed:

For the midterm project, I researched the stroke dataset to help confirm if it was a good fit before we got it approved. I reviewed the notebook and results to check that the outputs looked correct. I also worked on the URL document, making sure the Kaggle source link was accurate and presented well. Lastly, I went through our reflective journal to check for errors and make sure everything read clearly.
